Aircraft Glass Cockpit Operation and Maintenance is an introduction into aircraft glass cockpit systems. The book is written for all technicians who want to learn about the more complex indicating systems. If you are an A&P that desires to learn more about the modern aircraft they are working. Or if you are a technician from Canada or Europe this book will help you with the Advanced Avionics segment for certification. This book will help anyone who wants to learn more about how all of the navigation and indicating flight systems "talk" to each other or just to look into the complication world of a modern aircraft cockpit. This book covers how a cathode ray tube works and the new light emitting diode and liquid crystal display systems. In this book, you will also learn about the new heads-up guidance systems that are now becoming standard in large aircraft. This book begins with the progression of glass displays into cockpits to how these complicated systems communicate with the crew and the aircraft flight management systems. Starting with the cathode ray tube, to liquid crystal to light emitting diodes this book teaches how these displays operate and how they might fail. This book will provide an aircraft general familiarization courses on the glass instrument indicating systems for a variety of aircraft. For general aviation aircraft this book covers the Garmin g 1000 system for air carrier aircraft there are sections for the Boeing 757 and 737 or the Bombardier CRJ and Challenger indication systems. With just under 300 pages of full color 8 1/2 by 11 this book is full of drawings and diagrams to help visualize, in simple terms, the complex systems that are becoming standard for aircraft manufactured today.

NASA commissioned the Columbia Accident Investigation Board (CAIB) to conduct a thorough review of both the technical and the organizational causes of the loss of the Space Shuttle Columbia and her crew on February 1, 2003. The accident investigation that followed determined that a large piece of insulating foam from Columbia's external tank (ET) had come off during ascent and struck the leading edge of the left wing, causing critical damage. The damage was undetected during the mission. The Columbia accident was not survivable. After the Columbia Accident Investigation Board (CAIB) investigation regarding the cause of the accident was completed, further consideration produced the question of whether there were lessons to be learned about how to improve crew survival in the future. This investigation was performed with the belief that a comprehensive, respectful investigation could provide knowledge that can protect future crews in the worldwide community of human space flight. Additionally, in the course of the investigation, several areas of research were identified that could improve our understanding of both nominal space flight and future spacecraft accidents. This report is the first comprehensive, publicly available accident investigation report addressing crew survival for a human spacecraft mishap, and it provides key information for future crew survival investigations. The results of this investigation are intended to add meaning to the sacrifice of the crew's lives by making space flight safer for all future generations.

"Ethnographic study of the constitution of algorithms"--

The conventional approach to risk communication, based on a centralized and controlled model, has led to blatant failures in the management of recent safety related events. In parallel, several cases have proved that actors not thought of as risk governance or safety management contributors may play a positive role regarding safety. Building on these two observations and bridging the gap between risk communication and safety practices leads to a new, more societal perspective on risk communication, that allows for smart risk governance and safety management. This book is Open Access under a CC-BY licence.

"This book emphasizes the physical and practical aspects of fatigue and fracture. It covers mechanical properties of materials, differences between ductile and brittle fractures, fracture mechanics, the basics of fatigue, structural joints, high temperature failures, wear, environmentally-induced failures, and steps in the failure analysis process."--publishers website.

In Douglas Adams' book 'Hitchhiker's Guide to the Galaxy', hyper-intelligent beings reached a point in their existence where they wanted to understand the purpose of their own existence and the universe. They built a supercomputer, called Deep Thought, and upon completion, they asked it for the answer to the ultimate question of life, the universe and everything else. The computer worked for several millennia on the answers to all these questions. When the day arrived for hyper-intelligent beings the to receive the answer, they were stunned, shocked and disappointed to hear that the answer was simply 42. The still open questions to scientists and engineers are typically much simpler and consequently the answers are more reasonable. Furthermore, because human beings are too impatient and not ready to wait for such a long period, high-performance computing techniques have been developed, leading to much faster answers. Based on these developments in the last two decades, scientific and engineering computing has evolved to a key technology which plays an important role in determining, or at least shaping, future research and development activities in many branches of industry. Development work has been going on all over the world resulting in numerical methods that are now available for simulations that were not foreseeable some years ago. However, these days the availability of supercomputers with Teraflop performance supports extensive computations with technical relevance. A new age of engineering has started.
