Boundary scan (JTAG) is a powerful testing scheme that is widely used in nowadays circuits to maintain and verify operation of the hardware. However, JTAG is not used in cryptographic hardware since it may be used to compromise security of the implemented cryptographic algorithm. This paper analyses

The boundary-scan test architecture provides a means to test

interconnects between integrated circuits on a board without using physical test probes. It adds a boundary-scan cell that includes a multiplexer and latches to each pin on the device. Boundary-scan cells in a device can capture data
