December 13, 2011 by Gus Breiland, Customer Service Engineering Manager at Proto Labs. CAD/CAM/CAEplastic part designProto Labs. To understand the importance of uniform wall thickness in rapid injection molding, imagine that the fluid injected into a mold is water rather than plastic resin. In a properly vented mold, the water, following the path of least resistance, will quickly and uniformly fill every nook and cranny regardless of the shape and size of the mold's features.

Designing the mold. The mold used in injection molding is composed of two halves. They are known as the cavity side (side A) and the core side (side B). The core side is where the ejector plate and ejector pins are located. Once the molten plastic solidifies, the side A moves up and the side B then ejects the part resting on it using ejector pins.
