Antistatic sprays from several different manufacturers are examined. The sprays are examined for contamination potential (i.e., outgassing and nonvolatile residue), corrosiveness on an aluminum mirror surface, and electrostatic effectiveness. In addition, the chemical composition of the antistatic sprays is determined by infrared spectrophotometry, mass spectrometry, and ultraviolet spectrophotometry. The results show that 12 of the 17 antistatic sprays examined have a low contamination potential. Of these sprays, 7 are also noncorrosive to an aluminum surface. And of these, only 2 demonstrate good electrostatic properties with respect to reducing voltage accumulation; these sprays did not show a fast voltage dissipation rate however. The results indicate that antistatic sprays can be used on a limited basis where contamination potential, corrosiveness, and electrostatic effectiveness is not critical. Each application is different and proper evaluation of the situation is necessary. Information on some of the properties of some antistatic sprays is presented in this document to aid in the evaluation process. Ming, James E. Goddard Space Flight Center

"What matters in understanding digital media? Is looking at the external appearance and audience experience of software enough--or should we look further? In Expressive Processing, Noah Wardrip-Fruin argues that understanding what goes on beneath the surface, the computational processes that make digital media function, is essential. Wardrip-Fruin suggests that it is the authors and artists with knowledge of these processes who will use the expressive potential of computation to define the future of fiction and games. He also explores how computational processes themselves express meanings through distinctive designs, histories, and intellectual kinships that may not be visible to audiences. Wardrip-Fruin looks at "expressive processing" by examining specific works of digital media ranging from the simulated therapist Eliza to the complex city-planning game SimCity. Digital media, he contends, offer particularly intelligible examples of things we need to understand about software in general; if we understand, for instance, the capabilities and histories of artificial intelligence techniques in the context of a computer game, we can use that understanding to judge the use of similar techniques in such higher-stakes social contexts as surveillance."--Back cover.

This new edition of Friedman's landmark book explains the flattening of the world better than ever- and takes a new measure of the effects of this change on each of us.

Anyone with any kind of digital presence is a publisher. That includes web sites, but also businesses that blog, are present on social media sites such as Facebook, YouTube or Twitter, and even companies that publish and disseminate content digitally, such as white papers, e-books, podcasts, etc. The reason for this shift is clear: it's easier and cheaper than ever to have a digital presence - and to use your digital profile to market to your customers and prospects. Doing so reduces, and in some cases, eliminates, the need for advertising. Why buy media when you ARE the media? But as we all know, with great power comes great responsibility. What kind of content should you publish? In what forms, and on what platforms? How do you ensure that you'll keep having things to say, and how will you say them effectively, in a consistent "voice" unique to your organization? How will you know if your content strategy is working?
