In the time span of 27 months two natural draught cooling towers (NDCTs) have been built for 2 x 600 MW Kalisindh Thermal Power Station at Jhalawar, India with height of 202 m above the finished ground level (FGL) and 212 m from founding level. These NDCTs are the tallest cooling towers world-wide.

Abstract -A cooling tower is a vital element of power plants, petrochemical plants, petroleum refineries, semi-conductor plants, natural gas processing plants, food processing plants, etc. The major function of a cooling tower is to discard heat into the environment.

Design and Analysis of Cooling Tower

This Guideline, “Structural Design of Cooling Towers” continues to constitute the joint basis – together with VGB-R 135 e, “Planning of Cooling Towers”, and VGB-R 612 e, “Protection Measures on Reinforced Concrete Cooling Towers and Chimneys against Operational and Environmental Impacts” – for the civil engi- neering-related planning including design, construction and approval as well as the construction of cooling tower facilities built from reinforced concrete.

Structural Design of Cooling Towers - VGB

The cooled water is collected at the bottom of the tower. Cooling towers were invented during the industrialisation of the 19th century through the development of condensers for use with the steam engine. By the early 20th century, advances in cooling towers were fueled by the rapidly growing electric power industry.

A cooling tower is a heat rejection device that rejects waste heat to the atmosphere through the cooling of a water stream to a lower temperature. Cooling towers may either use the evaporation of water to remove process heat and cool the working fluid to near the wet-bulb air temperature or, in the case of closed circuit dry cooling towers, rely solely on air to cool the working fluid to near ...

Cooling tower - Wikipedia

Cooling towers lose water by evaporation and entrainment (windage), resulting in a water spray and fog on the downwind side of the tower making any roads continually wet. This is a traffic hazard and can cause icing in winter. In general, a minimum distance of 15 to 20 meters of clear area should be allocated for air movement about the tower. 4. Water Makeup. Water makeup to a cooling tower is ...

The towers, which rise to 202m, are two metres taller than the current biggest cooling towers of Niederaussem in Germany. The first tower was completed in June. The towers are part of the \$820 million Kalisindh Thermal Energy Plant, which has been funded by the Rajasthan Government and is being built by BGR Energy Systems.

World's tallest cooling towers take shape in India...

Since cooling towers are supposed to cool the working fluid down to a low temperature, they release vapors into the atmosphere through the opening at the top of the tower. Therefore, these towers have to be sufficiently tall (they can be as tall as 200 meters!), or else the released vapor may cause fogging or recirculation. To support such a high structure, it is extremely important that the ...
