Fundamental of The Psychrometric Chart - HVAC - Psychrometry is the science dealing with the physical laws of air & water mixtures. When designing an air conditioning system, the temperature and moisture content of the air to be conditioned, and the same properties of the air needed to produce the desired air conditioning effect, must be known.

The cooling capacity of the refrigeration system for this psychrometric facility should be oversized of about 1 tons of refrigeration (12,000 Btu/hr) at air temperature of -40[degrees]F. This additional capacity compensates for the heat transfer gain from the surrounding into the outdoor climate chamber when it operates below freezing temperature.

comfort. This can be accomplished through use of psychrometric tables or a psychrometric chart. The tables are somewhat more accurate, but the chart is accurate enough for all practical purposes and is much easier to use. Before we start to explain the psychrometric chart, let us review a few of the principles on which it is based.

A psychrometric chart is a graph of the thermodynamic parameters of moist air at a constant pressure, often equated to an elevation relative to sea level. The ASHRAE-style psychrometric chart, shown here, was pioneered by Willis Carrier in 1904. It depicts these parameters and is thus a graphical equation of state. The parameters are:
