The rapidly expanding urban surfaces of today are generally impervious to water and are a key environmental indicator (Arnold and Gibbons 1996) that can be measured with remote sensing. Roads,...

Impervious surface data is important for urban planning and environmental and resources management.

Therefore, remote sensing of impervious surfaces in the urban areas has recently attracted unprecedented attention. In this paper, various digital remote sensing approaches to extract and estimate impervious surfaces will be examined.

information of impervious surface cover from medium or low resolution imagery is therefore an important research topic (Mohapatra and Wu, 2010, Van de Voorde et al., 2008, Wu, 2004, Yuan et al., 2008). The basic idea is that sub-pixel fractions of different land-cover types within a pixel can be derived from the composite spectrum by spectral mixture analysis or regression techniques.

Although remote sensing data brings  
desirable properties (large cover-  
age, information of spectral reflectance,  
etc.), impervious surface estimation is  
still a difficult task due to the complex-  
ity of urban/suburban land cover, as  
well as the limitations of spectral and  
spatial resolution of remote sensing  
imagery (Lu and Weng, 2006).

By 2017, the total impervious surface  
area in China has been 209,950 km<sup>2</sup>  
while in Japan this value was 14,290  
km<sup>2</sup>, 6.8% of China's total. The 2017  
per capita impervious surface area of  
Chinese people (151.7 m<sup>2</sup>) was 35%  
more than that of Japanese people  
(112.7 m<sup>2</sup>). China's over-expansion  
in land development is worthy of  
deeper analysis.
