The complex field of analytical chemistry requires knowledge and application of the fundamental principles of numerical calculation. Problems of Instrumental Analytical Chemistry provides support and guidance to help students develop these numerical strategies to generate information from experimental results in an efficient and reliable way. Exercises are provided to give standard protocols to follow which address the most common calculations needed in the daily work of a laboratory. Also included are easy to follow diagrams

to facilitate understanding and avoid common errors, making it perfect as a hands-on accompaniment to in-class learning. Subjects covered follow a course in analytical chemistry from the initial basics of data analysis, to applications of mass, UV-Vis, infrared and atomic spectrometry, chromatography, and finally concludes with an overview of nuclear magnetic resonance. Intended as a self-training tool for undergraduates in chemistry, analytic chemistry and related subjects, this book is also useful as a reference for scientists looking to brush up on their

physical principles of different operations of chemical analysis in aqueous solutions. Once these principle are firmly established, numerous examples of applications are also given.

This book intends to be neither a complete survey of the field nor an exhaustive source of references. For these purposes, the use of the extensive compilation "Experimental Immunochemistry" by E. A. KABAT and M. M. MAYER (1962) or the excellent methodological textbook, "Methods in Immunology", by D. H. CAMPBELL, J. S.

GARVEY, E. E. CREMER and D. H. SUSSDORF (1963), or the quite comprehensive series "Methods in Immunology and Immunochemistry" by C. A. WILLIAMS and M. W. CHASE (1967) are more suitable. The main purpose of this manual is to provide students with a simple book which will introduce them to some frequently occurring problems in the three major sections of the immunochemistry of natural products. These are the isolation of the materials, the chemical analysis of the constituents and their structure, and, finally, the assays of the most important biological and immunological

activities. In this manual the exercises are simplified and several shortcuts are taken in order to fit them into the framework of a teaching course. The introduction to each exercise gives a brief and elementary explanation of the reaction on which it is based. "Materials and Equipment" lists all tissues or cells, chemicals, glassware, and special equipment which must be available to carry out the exercise, although the very common laboratory tools are usually omitted from the list.
